	PROJECT TYPE	TEAM	TOOLS	TIMELINE
	Uber-Sponsored Capstone Project	3 Product Designers (including me), 1 Software Engineer	Figma, Claude Code, Cursor, Vercel	6 months (Jan–Jun 2026)
	OVERVIEW			
	As the FIFA World Cup 2026 approaches, Uber is preparing for a surge in large-event pickups . We redesigned the rider experience to help people support confident pickup decisions , reduce uncertainty throughout the pickup journey, and improve pickup coordination.			
	WHAT I DID			
	- Led end-to-end user research and synthesis - Designed the primary rider experience and key user flows - Built and deployed the interactive prototype with Cursor and Vercel - Served as the primary contact between the team and Uber stakeholders			

Impact section.

MY IMPACT

Testing showed improvements in rider trust and perceived control under crowded pickup conditions

39%

Increased rider trust in the pickup process

Based on post-test interviews

43%

Increased rider perceived control

Based on post-test interviews

Problem Section

THE PROBLEM

Large-event pickups lead to failed matches and longer waits.

After leaving an event, riders must quickly find a pickup spot while navigating crowded streets, road closures, and constantly changing conditions.

Why it matters?

Rider

Makes decisions with limited guidance, leading to uncertainty and longer waits.

Driver

Spends more time locating riders instead of completing trips.

Business

Lower pickup success reduces ride completion and marketplace efficiency.

WE REFRAME THE CHALLENGE

How might we reduce uncertainty throughout the pickup journey to help riders make confident decisions?

These insights shaped three design principles that guided our design decisions while aligning with Uber's existing design guidelines.
(This case study focuses on the highest-priority opportunity: helping riders confidently choose a pickup location.)

01

Balance transparency with comfort

Show enough information to build confidence without increasing anxiety.

02

Preserve map clarity and readability

Add guidance without compromising the map's readability.

03

Support confident trade-off decisions

Help riders compare walking time, wait time, and price without cognitive overload.

DESIGN GOAL

Increase successful pickups by helping riders confidently choose a pickup location.

↘ Ride cancellations before pickup ↗ Pickup completion rate

ITERATION

2 pickup options worked better than 1 and many

Once the interaction model was set, we tested whether riders preferred seeing 1, 2, or multiple pickup options. Most participants preferred 2 options because it gave them enough information to compare trade-offs without feeling overwhelmed.

Reducing mental math in price comparison

Next, I refined how pricing was presented. When we first showed price savings, users paused to calculate the final price. They preferred seeing the total price because it made comparing options easier.

Directions:

I absolutely love the level of visual craft and execution that Jessica Hsu has made her portfolio's case studies with! I want to take her visual language, of simplicity, clean, white space with the grey box backgrounds and use this same visual language for my own case studies. At the moment my case studies use the projects main color as the background for boxes and accent colours, but I no longer want to continue with that language. I want to have the same white and grey monotone style for every case study so there is consistency across case studies. I want the same level of visual polish and execution
